

## Here – Notes App

### **Description**

The idea of Here is to create a free app that allows for most of your daily organization to be conveniently and easily stored in one location: Here. The app is supposed to be a hybrid of many types of apps that help people manage their lives. It will solve the problem of having information stored in many different locations and apps causing forgetfulness. It means that users will no longer have to sync many different apps to see the information overlayed, it will all be in Here. This should save users time and prevent frustration since information will be less likely to be forgotten or lost. Users will be motivated to use the app since there is only one place to work on many things for organizing their lives. All of these different types of information will be interactive in the app allowing for a high customizability of how a user can view and digest what they need to do.

### **Features**

- Calendars
- To-do list
- Reminders
- Shopping list
- Workout routine
- Habits
- General notes

### **CS Stuff**

I would use C++, Javascript, and React to complete this project.

### **Customer Base**

The app is aimed to help the average person organize their lives in a better manner.
